ISO-NO Mark II — line powered with electrically isolated electrode circuitry.
Redox current over a dynamic range exceeding 1,000,000 to 1 can be accommodated by the "front end" of this instrument without overload or the need for range changing. Background current at any level can be offset to "zero" level to allow external recorders to vary scale factor if necessary. Working in conjunction with WPI's full range of nitric oxide sensors, the Mark II provides a digital panel indication simultaneously of both picoamperes and, when calibrated by the user, nanomolar NO concentration. Five different filtering cutoffs result in low noise signals.

In addition to the original 2 mm shielded sensor, WPI offers NO sensors with tip diameters of 200 µm and 30 µm, a new in vivo sensor, and a gas phase sensor. All sensors offer the same advantages of real-time measurements—down to concentrations of 1 nM (dissolved) or ppb range (gas sensor)—and high immunity to electrostatic noise, while at the same time offering unprecedented performance, economy, and selectivity.
