The pH sensitivity of Aqp0 channels in tetraploid and diploid teleosts 2172-2184

Role of extracellular histones in the cardiomyopathy of sepsis 2185-2193

Adrenergic and serotonin receptors affect retinal superoxide generation in diabetic mice: relationship to capillary degeneration and permeability 2194-2204

Cover Legend: Edward McKnight Kauffer (1890–1954): Mechanical Man, for a Gas, Light and Coke Co. ca. 1935; Brush, guache, graphite on cream paper. Born in Montana, raised in an orphanage, and migrating to San Francisco in his teens, Kauffer studied art at Mark Hopkins Institute at night and took a job at a local bookstore by day. There he befriended one of the steady customers, Joseph McKnight, a professor of education at University of Utah, who was impressed by the boy’s talent and underwrote further training at the Académie Moderne in Paris. As a token of gratitude, Kauffer adopted “McKnight” as his middle name. In London, he gained fame as one of the leading designers of posters for British Underground Electric Railroad. He also maintained a lifelong interest in literature, serving as art director of the publisher Lund & Humphries and befriending such luminaries as T. S. Eliot, Aldous Huxley, Marianne Moore, and Eudora Welty. He also designed illustrations for many of Eliot’s poems (i.e., “Ariel”) and the dust jacket for Huxley’s “Point Counter Point.” Kauffer was named Honorary Fellow of the Council of Arts and Industry (1934), the Royal Society of Arts (1936), and served on the advisory council of the Victoria and Albert Museum. In 1937, he was given a solo exhibition at The Museum of Modern Art for which Aldous Huxley wrote a catalogue essay. He wrote: “McKnight Kauffer reveals his affinity with all artists who...aim at expressiveness through simplification, distortion, and transposition, especially the Post-Impressionists. It is his distinction that he was among the first and best of the contemporary artists to apply these principles to the design of advertisements.” Our cover image is an example of Kauffer’s simplified, formalized, hard-edged style. His “Mechanical Man” focuses on different systems of measurement: vision, motion, and time. It expresses his belief that technology can move man steadily into the future. In this issue, we learn that the future of cells, as determined by telomere length, can be extended by transient delivery of modified mRNA encoding TERT, the telomerase reverse transcriptase.
