COVER: Three rabbit liver glycerogen molecules viewed by scanning tunneling microscopy. The specimen was air-dried from an aqueous solution deposited on highly ordered pyrolytic graphite. Apparent surface detail may be the consequence of a laminar internal structure. See Yang et al., page 3140.

Designed to report on rapidly changing developments in biological sciences, The FASEB Journal publishes brief, definitive, original research communications and state-of-the-art reviews, as well as editorials, letters, a book list, news items, calendars, public affairs, and employment opportunities. The views expressed in articles are those of the authors and not necessarily those of the Federation. All manuscripts are subject to review and approval by the Editors before publication.
