Supplemental Figure 2. Fibrotic and Injury markers in bleomycin-exposed mice treated with STAT-3 inhibitor. Total RNA was isolated from whole lung mice and transcripts were determined for Twist (A), Snail (B) and HSP-70 (C). Transcripts were measured in parallel with 18S rRNA and values are presented as mean of fold change transcripts ± SEM, n≥8 (*, p ≤ 0.05 PBS DMSO vs. BLM DMSO; #, p ≤ 0.05 BLM DMSO vs. BLM C-188-9).
